TITCHENER et al. Appl. No. 10/566,310 November 12, 2008

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the

application:

Claims 1-13. Canceled.

14. (Previously Presented) A method of enhancing safety of a stairlift installation

comprising a rail extending between upper and lower ends of a staircase, a carriage moveable

along the rail, and carriage call switches positioned and manually operable remote from the

carriage so that said carriage can be displaced along said rail from positions remote from said

carriage, the method comprising: providing a proximity sensor to disable the carriage call

switches when a person is proximate the carriage.

15. (Previously Presented) The method of claim 14, in which providing the proximity

sensor comprises mounting the proximity sensor proximate the carriage.

16. (Previously Presented) The method of claim 14, in which a chair is mounted on

the carriage, and the method further comprises providing an occupancy sensor to sense when a

load is applied to the chair.

17. (Previously Presented) The method of claim 16, in which the chair is foldable,

the method further comprising providing a sensor to sense when the chair is folded.

TITCHENER et al. Appl. No. 10/566,310

November 12, 2008

18. (Previously Presented) A stairlift assembly, comprising a rail extending between

upper and lower ends of a staircase; a carriage moveable along the rail; and carriage call switches

positioned and manually operable remote from the carriage whereby said carriage may be

displaced along the rail from positions remote from said carriage; the assembly comprising; a

proximity sensor to sense the proximity of a person to the carriage and to render the carriage call

switches inoperative in response to sensing the proximity of the person.

(Previously Presented) The assembly of claim 18, in which the proximity sensor

is mounted proximate the carriage.

20. (Previously Presented) The assembly of claim 18, further comprising a chair

mounted on the carriage, and in which at least part of the proximity sensor being mounted on the

chair.

(Previously Presented) The assembly of claim 20, further comprising an

occupancy sensor to detect presence of a user seated in the chair.

22. (Previously Presented) The assembly of claim 21, in which the occupancy sensor

comprises a load sensor to sense load on a chair base.

23. (Previously Presented) The assembly of claim 20, in which the chair is foldable,

the assembly further comprising a position sensor to sense when the chair is folded.

TITCHENER et al. Appl. No. 10/566,310

November 12, 2008

24. (Previously Presented) The assembly of claim 18, in which the proximity sensor

is a capacitance type proximity sensor.

Claims 25-30. Canceled.

31. (Previously Presented) The assembly of claim 18, wherein the upper and lower

ends of the rail are not within one another's line of sight.

32. (New) A method of enhancing safety of a stairlift installation comprising a rail

extending between upper and lower ends of a staircase, a carriage moveable along the rail, and a

carriage call switch remote from the carriage, the method comprising; providing a proximity

sensor to disable the carriage call switch when a person is proximate the carriage.

33. (New) The method of claim 32, in which providing the proximity sensor

comprises mounting the proximity sensor proximate the carriage.

34. (New) The method of claim 32, in which a chair is mounted on the carriage, and

the method further comprises providing an occupancy sensor to sense when a load is applied to

the chair.

35. (New) The method of claim 34, in which the chair is foldable, the method further

comprising providing a sensor to sense when the chair is folded.

November 12, 2008

36. (New) A stairlift assembly, comprising a rail extending between upper and lower

ends of a staircase; a carriage moveable along the rail; and a carriage call switch remote from the

carriage; the assembly comprising: a proximity sensor to sense the proximity of a person to the

carriage and to render the carriage call switch inoperative in response to sensing the proximity of

the person.

37. (New) The assembly of claim 36, in which the proximity sensor is mounted

proximate the carriage.

38. (New) The assembly of claim 36, further comprising a chair mounted on the

carriage, and in which at least part of the proximity sensor being mounted on the chair.

39. (New) The assembly of claim 38, further comprising an occupancy sensor to

detect presence of a user seated in the chair.

40. (New) The assembly of claim 39, in which the occupancy sensor comprises a

load sensor to sense load on a chair base.

41. (New) The assembly of claim 38, in which the chair is foldable, the assembly

further comprising a position sensor to sense when the chair is folded.

42. (New) The assembly of claim 36, in which the proximity sensor is a capacitance

type proximity sensor.
